DETAILED ACTION

1. Applicant's election of Group I, claims 1-4 and 8-9 in the reply filed on 22 September 2008 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-4 and 8-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kazuo et al. (JP-A 2000-281438) in view of Badding et al. (U.S. 6,428,920 B1).

Kazuo teaches a zirconia sheet used for a solid electrolyte that has a maximum surface roughness of .3 to 3 microns and an Ra of .02 to 3 microns that has enhanced ability to adhere to electrodes in fuel cells (see the English abstract). Badding et al. teaches the optimization of surface roughness of an electrolyte layer on both sides between electrodes with a surface roughness of greater than .2 microns to increase power density (col. 4, lines 15-45, col. 7-lines 5-15). The instant invention claims an surface roughness of an oxide layer that has an Ra, Rz and Rmaz within certain ranges

on both sides of the layer. It would have been obvious to one of ordinary skill in the art to have optimized the peak height and average surface roughness of Kazuo in order to optimize the ability of electrodes to adhere to the oxide layer as well as the power density because of the teachings of Badding et al.
